**YONEX INTRODUCES THE NEW CYBERSTAR VX IRON**

Torrance, CA – January 25, 2005: The Yonex Corporation announces the introduction of its new iron, the **Cyberstar VX**. The iron will be added to the successful Cyberstar product line, featuring UL-Titanium™ composite shaft technology used exclusively by Yonex. A set of **Cyberstar VX** irons will include the 3-iron through pitching wedge. Suggested retail price is \$1,280.00

The **Cyberstar VX** features the new exclusive “Dual Core” head technology with an Ultra Thin SUS 60 Stainless Steel clubface. “Dual Core” head technology allows the clubface to “compress” and “release” at impact resulting in a longer ball carry and more forgiveness on miss-hits. The Ultra Thin SUS 60 Stainless Steel clubface is only 1.2 mm thin, which reduces the head weight by 10 grams.

“Tungsten Balanced” weighting in the clubhead is designed to provide additional head stability and less twisting at impact. This technology deepens and lowers the center of gravity, which enables the ball to get airborne more easily.

The **Cyberstar VX** is designed to help golfers of all skill levels hit longer more consistent shots, and features a “Supercharged” UL-Titanium 70+ Graphite shaft which is designed and engineered to enhance the specific performance characteristics of each iron throughout the **Cyberstar VX** iron set.

Yonex has incorporated strands of UL-Titanium strategically positioned within the shaft to deliver ultimate power. UL-Titanium is a nickel/titanium alloy that **is 3 times stronger than titanium and 2 times more resilient than graphite!**

If you hold a UL-Titanium fiber and pull it, it stretches. Release the fiber and it immediately “snaps back” to its original shape, transferring maximum energy to the ball.
